

## **JPX~E Usage Guide**

**JPX~E** is applied during the initial degreasing phase of the chemical cleaning sequence. It may be added during steam injection or with the degreasing circulation or refluxing of the **JPX**. The H<sub>2</sub>S concentration reduction is measured an hour after the introduction of **JPX~E**. An additional quantity of **JPX~E** may be applied to complete the H<sub>2</sub>S reduction. This stringent application assures minimum cost by eliminating overdosage. Consult our technical staff for more information about specific applications , cleaning methods and foaming equipment available.
